MECCANO AEROPLANE CONSTRUCTOR PARTS

ECCAINC

Now is the time for every boy to learn how aeroplanes are designed and constructed, and to recognise at a glance the different types. The best way of doing this is for a boy to build aeroplanes for himself, and the Meccano Aeroplane Constructor Outfits have been designed specially for this purpose. The parts contained in them enable aeroplane construction to be carried out on sound engineering lines and it is splendid fun to build up with them models of different types of aircraft in actual use. This folder shows how to construct six different machines, but a large number of other splendid models may be built by varying the positions of the parts. These parts are all interchangeable on the Meccano principle and can be used in conjunction with the standard Meccano parts.

both passengers and goods. In addition, there will be countless privately-owned aeroplanes and other light machines, and in these flights may be made to distant lands with little more preparation than now is necessary for a motor car journey of a few miles. Meccano Aeroplane Constructor Parts List

The aeroplane is rapidly taking its place as a regular means of high speed transport, and the time is not far distant when we shall use it as readily as to-day we employ the train, the steamship, and the motor car. In future we shall cross the oceans in giant flying boats that will traverse well-marked routes. Overland routes will be even more numerous than those across the seas, and these will be thronged with aeroplanes carrying

AEROPLANE CONSTRUCTOR

All these Fine Models can be built with Meccano Aeroplane Constructor Outfit No. 1

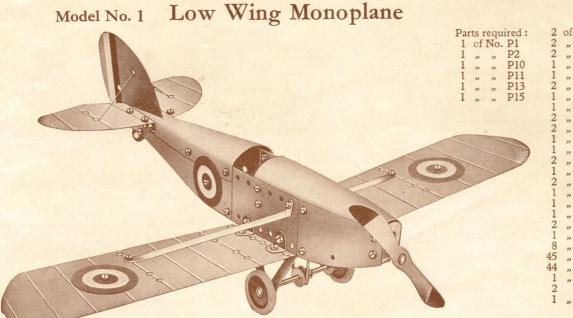

Aeroplanes are of two main types, monoplanes, having only one wing, and biplanes having two wings. Monoplanes may be sub-divided into three classes, known respectively as the low wing, the high wing, and the parasol types. They are usually parasol types. They are usually faster than biplanes of similar weight with engines of equal power, and a better view is to be obtained from them. The landing speed of monoplanes is generally higher, however, and biplanes are more stable in the

Model No. 1 is a monoplane of the low wing type. Machines of this type are often regarded as the best for speed, and they are largely used by German air lines. Captain Frank Hawks used a low wing monoplane for his received fights.

Hawks used a low wing monoplane for his record-breaking flights.

A typical British low wing machine is the Avro "Avian Monoplane."

Other notable British monoplanes of this type are the D.H. "Tiger Moth," the Blackburn-Segrave "Meteor," the Hendy 302, and the Monospar, the last three being of the cabin type.

High wing monoplanes are probably the most popular monoplane aircraft. They are usually more stable than the low wing type, and the view down-wards is much better, being prac-tically unobstructed.

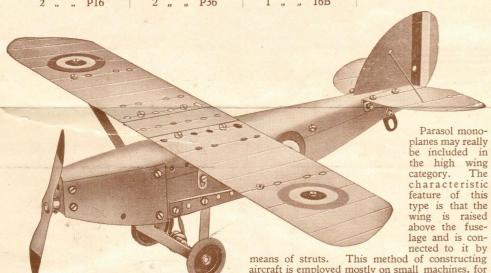

Machines of this type are used in all parts of the world, and they range from small single-seater machines to huge aircraft seating as many as 30 people. The "Spider" machine employed by the Duchess of Bedford on her numerous famous flights is of this type.

The De Havilland "Puss Moth" is a good British example of a high wing monoplane, while other notable machines include the Comper"Swift"

the Desoutter Coupé, the D.H.
"Hawk Moth," the Civilian Coupé,
the Avro V and VI, the Vickers
"Viastra," and the Westland
"Wessex."

in which the wing is bolted firmly to the fuselage. keep the plane in position offer great resistance to the wind, and thus detract considerably from the

all-round performance of the machine.

Typical British prototypes are the Boulton and Paul "Phænix" and the Westland "Widgeon."
These are both light aeroplanes, and each possesses accommodation for two people.

INSTRUCTIONS

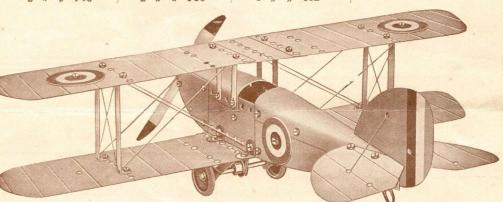

How to Build Model Aeroplanes with Meccano Aeroplane Constructor Outfit No. 1

FITTING THE PROPELLER DRIVING MECHANISM.

METHOD OF FITTING THE MAIN PLANES. In the monoplane models (with the exception of Model No. 3), the Main Plane sections are cured to the fuselage by means of Angle Bracksts. In Model No. 3, two Wing Stays and two entre Section (Straight) Struts are used to support the wing above the fuselge. The wing in sed of two Large Main Plane sections, and one Extension Plane which are overlapped and

In England biplanes are still more numerous than aeroplanes of the monoplane type. For many purposes it is almost essential that a machine should be fitted with two wings. A Service aeroplane, for instance, must not only be fast, but also capable of carrying a good load at both low and high altitudes. The great wing area of a biplane, although it involves a slight decrease in speed, gives the machine a greater carrying capacity.

Model No. 4 is a biplane of the light type. These machines are used mostly for civilian flying, although they are also employed in the R.A.F. It was on light aeroplanes that the wonderful flights to Australia were made by Mr. Bert Hinkler, Air Commodore Kingsford-Smith and Mr. C. W. A. Scott, and from Australia by Mr. J. A. Mollison.

The most popular British light biplane is the D.H. "Moth." Other typical machines of this type are the Avro "Avian," the Blackburn "Bluebird," the Robinson "Redwing" and the Spartan "Arrow."

Model No. 5 Single-Seater Fighter

Single-seater fighter machines are very fast aeroplanes, the function of which is to patrol certain sections of sky so that no enemy aircraft can pass. Recently a new type of machine known as the interceptor fighter has been produced. This is an extremely fast craft, capable of climbing high enough to intercept enemy bombers intent on raiding London, and whose approach is not discovered until they pass the coast. In these aeroplanes military load and fuel capacity are sacrificed to an exceedingly fast climb and a high maximum speed.

The world's best single-seater fighter probably is the Bristol "Bulldog," a machine that is used in the R.A.F. and in the Air Forces of many foreign countries. At present the Hawker "Fury" is the only type of single-seater interceptor fighter used in the R.A.F.

The requirements of a good training machine are many. It must be easy to fly and must be stable; its maximum speed must be fairly high, but its landing speed must be low. A piplane is best suited to comply with these conditions, and ordinary light aeroplanes are now frequently employed.

A training machine has been taken as a prototype for Model No. 6. The most famous machine of this type is the Avro 504, first designed and constructed in 1913. Since then it has been in constant service in all parts of the world, and it is still one of the best aircraft for its particular purpose. A more modern training machine is the Avro "Trainer," and another typical school aeroplane is the Hawker "Tomtit."
